first discussion

1. What is ServiceNow?

ServiceNow is a cloud platform used by companies to manage their work and services digitally. It helps organize things like incidents, requests, approvals, users, and workflows in one system. It is widely used in IT service management, but it can also be used in HR, customer service, security, and other business areas.

2. What is SLA?

SLA stands for **Service Level Agreement**. It is a rule or agreement that defines how fast a service should be delivered or how fast an issue should be solved. For example, an incident may need to be responded to within 1 hour and resolved within 8 hours. In ServiceNow, SLA helps track whether the team is meeting the required time.

3. What is an instance?

An instance is a separate ServiceNow environment with its own data and configuration. You can think of it as your own ServiceNow system or workspace. Each company can have multiple instances, and each instance can be used for a different purpose like development, testing, or production.

4. Why Dev Test Prod?

Companies use **Dev, Test, and Prod** to keep work organized and safe.

- **Dev** is where developers build and change features
- **Test** is where the changes are checked and validated
- **Prod** is the live environment used by real users

This separation is important because it prevents developers from breaking the live system while working on new changes. It also makes testing easier before releasing anything to users.
